#### Abstract

Two independent fixed sized samples are drawn from continuous uniform distributions on $\left(0, \theta_{1}\right)$ and $\left(0, \theta_{2}\right)$ respectively. Problem is to improve the estimator of $\theta_{1}$. If the hypothesis that $\theta_{1}=\theta_{2}$ is accepted, we use both the samples to estimate $\theta_{1}$; otherwise, use its UMVUE based on the first sample alone. The likelihood ratio test is developed to test this hypothesis. Its properties are studied. An improved estimator is suggested and its properties are studied. The mean square error (MSE) of this estimator is compared with the variance of UMVUE based on first sample. The regions in which new estimator is preferable are identified. Graphs for a few specific values are also given.

Keywords: Preliminary test estimation, Estimating parameter of rectangular distribution, improved estimator of parameter of continuous uniform distribution, Likelihood ratio test, Estimating parameter of continuous uniform distribution.

1.INTRODUCTION: Let $X_{1}, X_{2}, \ldots, X_{n}$ and $Y_{1}, Y_{2}, \ldots, Y_{m}$ be two independent random samples from continuous uniform probability distributions on $\left(0, \theta_{1}\right)$ and $\left(0, \theta_{2}\right)$ respectively. Let X and Y be the maximum values in these two samples respectively. The problem is to estimate the value of $\theta_{1}$. It is suspected but not known for sure that $\theta_{1}=\theta_{2}$ Therefore, we use the two samples to test the hypothesis that $\theta_{1}=\theta_{2}$. If the hypothesis is accepted, we use both the samples to estimate $\theta_{1}$; otherwise, use just the first sample. We provide here the necessary test and the estimator in this situation. We study the properties of the test and the estimator. This estimator is compared with the usual unbiased estimator based on maximum likelihood estimator based on single sample.
2. LIKELIHOOD RATIO TEST TO TEST Ho: $\theta_{1}=\theta_{2}$ : The pdf's of $X$ and Y are given by
$f_{\theta_{1}}(\mathrm{x})=\left(\mathrm{n} / \theta_{1}{ }^{\mathrm{n}}\right) \mathrm{x}^{\mathrm{n}-1}, 0<\mathrm{x}<\theta_{1}, \theta_{1}>0$
And $g_{\theta_{2}}(\mathrm{y})=\left(\mathrm{m} / \theta_{2}^{\mathrm{m}}\right) \mathrm{y}^{\mathrm{m}-1}, 0<\mathrm{x}<\theta_{2}, \theta_{2}>0$.
The joint pdf of $(\mathrm{x}, \mathrm{y})$ is
$f_{\theta_{1}, \theta_{2}}(\mathrm{x}, \mathrm{y})=\left[\mathrm{mn} /\left(\left(\theta_{1}{ }^{\mathrm{n}}\right)\left(\theta_{2}{ }^{\mathrm{m}}\right)\right)\right] \mathrm{x}^{\mathrm{n}-1} \mathrm{y}^{\mathrm{m}-1} I_{\left(0, \theta_{1}\right)}(\mathrm{x}) I_{\left(0, \theta_{2}\right)}(\mathrm{y})$
The parameter space is,

$$
\Theta=\left\{\left(\theta_{1}, \theta_{2}\right), \theta_{1}=\theta_{2}, \theta_{1}>0, \theta_{2}>0\right\}
$$

To test Ho: $\theta_{1}=\theta_{2}$ against $\mathrm{H}_{1}: \theta_{1} \neq \theta_{2}$, we have,

$$
\Theta_{0}=\left\{\left(\theta_{1}, \theta_{2}\right), \theta_{1}=\theta_{2}, \theta_{1}>0, \theta_{2}>0\right\}
$$

$\operatorname{and} \Theta_{1}=\left\{\left(\theta_{1}, \theta_{2}\right) ; \theta_{1} \neq \theta_{2}, \theta_{1}>0, \theta_{2}>0\right\}$

If $\theta_{1} \neq \theta_{2}$ and both are unknown, x and y are maximum likelihood estimators (mles) of $\theta_{1}$ and $\theta_{1}$ respectively. Therefore,
$\operatorname{Sup}(\theta \in \Theta))=f_{\theta_{1}, \theta_{2}}(x, y)=\left(n m /\left(x^{n} y^{m}\right)\right) x^{n-1} y^{m-1}=n m /(x y)$.
If $\theta_{1} \neq \theta_{2}=\theta$, say, the mle of $\theta$ is $\max (\mathrm{x}, \mathrm{y})$. Therefore,
$\operatorname{Sup}\left(\theta \in \Theta_{0}\right) \quad\left\{f_{\theta_{1}, \theta_{2}}(\mathrm{x}, \mathrm{y})\right\}=\left[\mathrm{nm} \mathrm{x}^{\mathrm{n}-1} \mathrm{y}^{\mathrm{m}-1} /\left\{(\max (\mathrm{x}, \mathrm{y}))^{\mathrm{m}+\mathrm{n}}\right\}\right]$
Therefore, the likelihood ratio

$$
\begin{align*}
\text { L.R. }(\mathrm{x}, \mathrm{y}) & =\frac{\sup (\theta \in \Theta)\left\{f_{\theta_{1} \theta_{2}}(\mathrm{x}, \mathrm{y})\right\}}{\operatorname{Sup}\left(\theta \in \Theta_{0}\right)\left\{f_{\theta_{1} \theta_{2}}(\mathrm{x}, \mathrm{y})\right\}} \\
& =\left[\left[\mathrm{nm} \mathrm{x}^{\mathrm{n}-1} \mathrm{y}^{\mathrm{m}-1} /\left\{(\max (\mathrm{x}, \mathrm{y}))^{\mathrm{m}+\mathrm{n}}\right\}\right] /[\mathrm{nm} / \mathrm{xy}]\right] \\
& =(\mathrm{y} / \mathrm{x})^{\mathrm{m}}, \text { if } \mathrm{x} \geq \mathrm{y} \tag{2.4}
\end{align*}
$$

Putting T=X/Y, we have,

$$
\begin{aligned}
\text { L.R. }(\mathrm{x}, \mathrm{y}) & =\mathrm{t}^{\mathrm{n}}, \text { if } \mathrm{t} \leq 1 \\
& =\mathrm{t}^{-\mathrm{m}}, \text { if } \mathrm{t}>1 .
\end{aligned}
$$

Thus, the likelihood ratio test to test Ho against $\mathrm{H}_{1}$ is: Reject Ho iff L.R.(x ,y) < c , where, c is some constant so chosen that size of the test becomes $\alpha$. The test is equivalent to: Reject Ho iff L.R. $(\mathrm{x}, \mathrm{y})=\mathrm{LR}(\mathrm{t})<\mathrm{c}$, i.e.; iff $\mathrm{t}^{\mathrm{n}}<\mathrm{c}$ for $0<\mathrm{t} \leq 1$ and $\left(1 / \mathrm{t}^{\mathrm{m}}\right)<\mathrm{c}$ for $\mathrm{t}>1$. That is, reject Ho if $\mathrm{t}<\mathrm{c}^{1 / \mathrm{n}}$ for $0<\mathrm{t} \leq 1$ and if t $>\mathrm{c}^{-1 / \mathrm{m}}$ for $\mathrm{t}>1$.

Thus, the test is

$$
\begin{align*}
\Phi(\mathrm{t}) & =1 \text {, if } \mathrm{t}<\mathrm{c}^{1 / \mathrm{n}} \text { for } 0<\mathrm{t} \leq 1 \text { and if } \mathrm{t}>\mathrm{c}^{-1 / \mathrm{m}} \text { for } \mathrm{t}>1 . \\
& =0, \text { otherwise. } \tag{2.5}
\end{align*}
$$

Applying equal tail criterion,

$$
\begin{equation*}
\mathrm{P}_{\mathrm{Ho}}\left\{\mathrm{t}<\mathrm{c}^{1 / \mathrm{n}}\right\}=\mathrm{P}_{\mathrm{Ho}}\left\{\mathrm{t}>\mathrm{c}^{-1 / \mathrm{m}}\right\}=\alpha / 2 \tag{2.6}
\end{equation*}
$$

To calculate probabilities in (2.6) we have to know the probability distribution of $T$. For this, let $T=X / Y$ and $U=Y$. If $0<t \leq\left(\theta_{1} / \theta_{2}\right), 0<u<\theta_{2}$.If $\left(\theta_{1} / \theta_{2}\right)<$ $\mathrm{t}<\infty, 0<\mathrm{u}<\left(\theta_{1} / \mathrm{t}\right) . \mathrm{X}=\mathrm{TU}$. The Jacobian of transformation

$$
\mathrm{J}=\left|\begin{array}{ll}
\frac{d x}{d t} & \frac{d y}{d t}  \tag{2.7}\\
\frac{d x}{d u} & \frac{d y}{d u}
\end{array}\right|=\left|\begin{array}{ll}
u & 0 \\
t & 1
\end{array}\right|=u .
$$

The joint pdf of T and U , using (2.3) and (2.7) is

$$
\begin{gather*}
h_{\theta_{1}, \theta_{2}}(\mathrm{u}, \mathrm{t})=\left(\mathrm{n} / \theta_{1}{ }^{\mathrm{n}}\right)\left(\mathrm{m} / \theta_{2}{ }^{\mathrm{m}}\right) \mathrm{t}^{\mathrm{n}-1} \mathrm{u}^{\mathrm{n}+\mathrm{m}-1}, 0<\mathrm{t}<\infty, 0<\mathrm{u}<\theta_{2}, 0<\mathrm{tu}<\theta_{1}  \tag{2.8}\\
=0, \text { otherwise. }
\end{gather*}
$$

Integrating (2.8) w.r.t. $u$, we get, the marginal pdf of T as

$$
\begin{align*}
h_{\theta_{1}, \theta_{2}}(x, y) & =\frac{n m}{n+m}\left(\frac{\theta_{2}}{\theta_{1}}\right)^{n} t^{n-1} \\
h_{\theta_{1}, \theta_{2}}(\mathrm{t}) & =(\mathrm{nm} /(\mathrm{n}+\mathrm{m}))\left(\theta_{2} / \theta_{1}\right)^{\mathrm{n}} \mathrm{t}^{\mathrm{n}-1}, 0<\mathrm{t} \leq\left(\theta_{1} / \theta_{2}\right) \\
& =(\mathrm{nm} /(\mathrm{n}+\mathrm{m}))\left(\theta_{1} / \theta_{2}\right)^{\mathrm{m}}\left(1 / \mathrm{t}^{\mathrm{m}+1}\right),\left(\theta_{1} / \theta_{2}\right)<\mathrm{t}<\infty . \tag{2.9}
\end{align*}
$$

If $\theta_{1}=\theta_{2}=\theta$, i.e.; under Ho, we have,

$$
\begin{align*}
h_{\theta}(\mathrm{t}) & =(\mathrm{nm} /(\mathrm{n}+\mathrm{m})) \mathrm{t}^{\mathrm{n}-1}, \quad 0<\mathrm{t} \leq 1 \\
& =(\mathrm{nm} /(\mathrm{n}+\mathrm{m}))\left(1 / \mathrm{t}^{\mathrm{m}+1}\right), 1<\mathrm{t}<\infty . \tag{2.10}
\end{align*}
$$

Note that this is independent of $\theta$.
If the samples are of equal size, i.e.; if $\mathrm{n}=\mathrm{m}$, (2.9) becomes,

$$
\begin{align*}
h_{\theta_{1}, \theta_{2}}(\mathrm{t}) & =(\mathrm{n} / 2)\left(\theta_{2} / \theta_{1}\right)^{\mathrm{n}} \mathrm{t}^{\mathrm{n}-1}, & & 0<\mathrm{t} \leq\left(\theta_{1} / \theta_{2}\right) \\
& =(\mathrm{n} / 2)\left(\theta_{1} / \theta_{2}\right)^{\mathrm{m}}\left(1 / \mathrm{t}^{\mathrm{m}+1}\right), & & \left(\theta_{1} / \theta_{2}\right)<\mathrm{t}<\infty . \tag{2.11}
\end{align*}
$$

If $\quad \theta_{1}=\theta_{2}=\theta$, as well as $\mathrm{n}=\mathrm{m}$, this reduces to

$$
\begin{align*}
\mathrm{h}(\mathrm{t}) & =(\mathrm{n} / 2) \mathrm{t}^{\mathrm{n}-1}, \quad 0<\mathrm{t} \leq 1 \\
& =(\mathrm{n} / 2)\left(1 / \mathrm{t}^{\mathrm{n}+1}\right), \quad 1<\mathrm{t}<\infty . \tag{2.12}
\end{align*}
$$

From (2.5), we have,

$$
(\mathrm{nm} /(\mathrm{n}+\mathrm{m})) \int_{0}^{c} \mathrm{t}^{\mathrm{n}-1} \mathrm{dt}=(\mathrm{nm} /(\mathrm{n}+\mathrm{m})) \int_{c 2}^{\infty}\left(1 / \mathrm{t}^{\mathrm{m}+1}\right) \mathrm{dt}=\alpha / 2 \text {. This gives }
$$

the critical region to be

$$
\begin{align*}
\mathrm{R}_{\alpha} & =\left\{\left(0,(\alpha(\mathrm{~m}+\mathrm{n}) /(2 \mathrm{~m}))^{(1 / \mathrm{n})}\right) \mathrm{U}\left((2 \mathrm{n} / \alpha(\mathrm{n}+\mathrm{m}))^{(1 / \mathrm{m})}, \infty\right)\right\} \\
& =\{(0, \sqrt[n]{(\alpha(\mathrm{m}+\mathrm{n}) /(2 \mathrm{~m}))} \mathrm{U}(\sqrt[m]{(2 \mathrm{n} / \alpha(\mathrm{n}+\mathrm{m}))}, \infty)\} \tag{2.13}
\end{align*}
$$

If $\mathrm{m}=\mathrm{n}$, the critical region reduces to, $\mathrm{R}_{\alpha}=\{(0, \sqrt[n]{\alpha}) \mathrm{U}(\sqrt[n]{1 / \alpha}, \infty)\}$. (2.14)
The power of the test (2.5) is given by,

$$
\begin{aligned}
& \beta_{\phi}\left(\Theta_{1}, \Theta_{2}\right)= \mathrm{E}_{\theta 1, \Theta 2}(\Phi(\mathrm{~T}))=\mathrm{P}\left[\left(\mathrm{t}<\mathrm{c}^{1 / \mathrm{n}}\right) \mathrm{U}\left(\mathrm{t}>\mathrm{c}^{-1 / \mathrm{m}}\right)\right] \\
&=\int_{0}^{\sqrt[n]{\left(\frac{\alpha(\mathrm{m}+\mathrm{n})}{2 \mathrm{~m}}\right)}} h(t ; \theta 1, \Theta 2) \mathrm{dt}+\int_{m}^{\infty} \sqrt{\left(\frac{2 \mathrm{n}}{\alpha(\mathrm{n}+\mathrm{m})}\right)} h(t ; \Theta 1, \Theta 2) \mathrm{dt} \\
&=\frac{n m}{n+m}\left(\frac{\theta 2}{\theta 1}\right) n \int_{0}^{\sqrt[n]{\left(\frac{\alpha(\mathrm{m}+\mathrm{n})}{2 \mathrm{~m}}\right)}} \mathrm{t}^{\mathrm{n}-1} d t+\frac{n m}{n+m}\left(\frac{\theta 1}{\Theta 2}\right) \mathrm{m} \int_{m}^{\infty} \sqrt{\left(\frac{2 \mathrm{n}}{\alpha(\mathrm{n}+\mathrm{m})}\right)}\left(1 / \mathrm{t}^{\mathrm{m}+1}\right) d t
\end{aligned}
$$

$=\frac{n m}{n+m}\left(\frac{\mathrm{e} 2}{\ominus 1}\right) n \alpha(\mathrm{~m}+\mathrm{n}) /(2 \mathrm{mn})+\frac{n m}{n+m}\left(\frac{\mathrm{e} 1}{\mathrm{\theta} 2}\right) \mathrm{m} \alpha(\mathrm{m}+\mathrm{n}) /(2 \mathrm{mn})$
$=\alpha / 2\left[\left(\theta_{2} / \theta_{1}\right)^{\mathrm{n}}+\left(\theta_{1} / \theta_{2}\right)^{\mathrm{m}}\right]=\frac{\alpha}{2}\left[\frac{\theta_{1}^{m+n}+\theta_{2}^{m+n}}{\theta_{1}^{n} \theta_{2}^{m}}\right]$
$=\frac{\alpha}{2}\left[\frac{\theta_{1}^{2 n}+\theta_{2}^{2 n}}{\left(\theta_{1} \theta_{2}\right)^{n}}\right]$, if $\mathrm{n}=\mathrm{m}$.

## 3. ESTIMATOR TO ESTIMATE $\boldsymbol{\theta}_{1}$ :

Consider the following estimator
$\mathrm{T}^{*}=\left\{\begin{array}{lr}X, & \text { if } T<\sqrt[n]{\frac{\alpha(n+m)}{2 m}} \text { or } T>\sqrt[m]{\frac{2 n}{\alpha(m+n)}} \\ Z, & \text { otherwise }\end{array}\right.$
where $\mathrm{Z}=\max (\mathrm{X}, \mathrm{Y})$
The pdf of Z is given by,
$\mathrm{f}\left(\mathrm{zI} \theta_{1}, \theta_{2}\right)=\left\{\begin{array}{ll}\frac{(n+m) z^{n+m+1}}{\theta_{1}^{n} \theta_{2}^{m}}, 0<z<\theta_{1} \\ \frac{m z^{m-1}}{\theta_{2}^{m}} & , \theta_{1} \leq z<\theta_{2} \\ 0 & , \text { otherwise }\end{array} \quad, \theta_{1}<\theta_{2}\right.$
And
$\mathrm{f}\left(\mathrm{zI} \theta_{1}, \theta_{2}\right)=\left\{\begin{array}{ll}\frac{(n+m) z^{n+m+1}}{\theta_{1}^{n} \theta_{2}^{m}}, 0<z<\theta_{2} \\ \frac{n z^{n-1}}{\theta_{1}^{n}} & , \theta_{2} \leq z<\theta_{1} \\ 0 & , \text { otherwise }\end{array} \quad, \theta_{2} \leq \theta_{1}\right.$

The expected value of Z is,
$\mathrm{E}(\mathrm{Z})=\left\{\begin{array}{l}\frac{n \theta_{1}^{m+1}}{(m+1)(n+m+1) \theta_{2}^{m}}+\frac{m \theta_{2}}{m+1}, \text { if } \theta_{1}<\theta_{2} \\ \frac{m \theta_{2}^{n+1}}{(n+1)(n+m+1) \theta_{1}^{n}}+\frac{n \theta_{1}}{n+1}, \text { if } \theta_{2} \leq \theta_{1}\end{array}\right.$
and
$\mathrm{E}\left(\mathrm{Z}^{2}\right)=\left\{\begin{array}{l}\frac{2 n \theta_{1}^{m+2}}{(m+2)(n+m+2) \theta_{2}^{m}}+\frac{m \theta_{2}^{2}}{m+2}, \text { if } \theta_{1}<\theta_{2} \\ \frac{2 m \theta_{2}^{n+2}}{(n+2)(n+m+2) \theta_{1}^{n}}+\frac{n \theta_{1}^{2}}{n+2}, \text { if } \theta_{2} \leq \theta_{1}\end{array}\right.$
If $\theta_{1}=\theta_{2}$,

1. $\mathrm{E}(\mathrm{Z})=\frac{n+m}{n+m+1} \theta_{1}$

Which is expectation of maximum of ( $\mathrm{n}+\mathrm{m}$ ) observations.
2. $\mathrm{E}\left(\mathrm{Z}^{2}\right)=\frac{m+n}{m+n+2} \theta_{1}^{2}$

Which is expectation of square of maximum of $(m+n)$ observations.
We have the p.d.f.s,
$\mathrm{f}_{\mathrm{X}}\left(\mathrm{x} \mid \theta_{1}\right)=\frac{n x^{n-1}}{\theta_{1}^{n}} \mathrm{I}_{\left(0, \theta_{1}\right)}(\mathrm{x})$
$\mathrm{f}_{\mathrm{Y}}\left(\mathrm{y} \mid \theta_{2}\right)=\frac{m y^{m-1}}{\theta_{2}^{m}} \mathrm{I}_{\left(0, \theta_{2}\right)}(\mathrm{y})$
$\mathrm{h}_{\mathrm{T}}\left(\mathrm{t} \mid \theta_{1}, \theta_{2}\right)= \begin{cases}\frac{n m}{n+m}\left(\frac{\theta_{2}}{\theta_{1}}\right)^{n} t^{n-1}, & 0<t<\frac{\theta_{1}}{\theta_{2}} \\ \frac{n m}{n+m}\left(\frac{\theta_{1}}{\theta_{2}}\right)^{m} \frac{1}{t^{m+1}}, & \frac{\theta_{1}}{\theta_{2}} \leq t<\infty\end{cases}$
$h_{Y, T}\left(y, t \mid \theta_{1}, \theta_{2}\right)=$

$$
\left\{\begin{array}{c}
\frac{m n}{\theta_{1}^{n} \theta_{2}^{m}} y^{m+n-1} t^{n-1}, 0<t<\infty, 0<y<\theta_{2}, 0<t y<\theta_{1}  \tag{3.6}\\
0 \quad, \text { otherwise }
\end{array}\right.
$$

If $\frac{\theta_{1}}{\theta_{2}} \leq t<\infty, 0<y<\frac{\theta_{1}}{t}$ and if $0<\mathrm{t}<\frac{\theta_{1}}{\theta_{2}}, 0<y<\theta_{2}$
$\mathrm{h}\left(\mathrm{y} \mid \mathrm{t}, \theta_{1}, \theta_{2}\right)=\left\{\begin{array}{c}\frac{n+m}{\theta_{1}^{n+m}} y^{m+n-1} t^{m+n}, 0<y<\frac{\theta_{1}}{t}, \frac{\theta_{1}}{\theta_{2}} \leq t<\infty \\ \frac{n+m}{\theta_{2}^{m+n}} y^{n+m-1}, 0<t<\frac{\theta_{1}}{\theta_{2}}, 0<y<\theta_{2} \\ 0, \text { otherwise }\end{array}\right.$
Let us put $\mathrm{Y}=\frac{X}{Y}, T=V, 0<\frac{X}{T}<\theta_{2}, 0<V<\infty$
Jacobean of transformation is,
$|J|=\left|\begin{array}{ll}\frac{d y}{d x} & \frac{d t}{d x} \\ \frac{d y}{d v} & \frac{d t}{d v}\end{array}\right|=\frac{1}{v}$
Therefore,
$\mathrm{h}\left(\mathrm{x}, \mathrm{v} \mid \theta_{1}, \theta_{2}\right)=\left\{\begin{array}{c}\frac{n m}{\theta_{1}^{n} \theta_{2}^{m}} \frac{x^{n+m-1}}{v^{m+1}}, 0<x<\theta_{1}, 0<v<\infty, 0<\frac{x}{v}<\theta_{2} \\ 0, \text { otherwise }\end{array}\right.$
In our notation, $\mathrm{V}=\mathrm{T}=\frac{X}{Y}$, therefore,
$\mathrm{h}\left(\mathrm{x}, \mathrm{t} \mid \theta_{1}, \theta_{2}\right)=$

$$
\begin{cases}\frac{n m}{\theta_{1}^{n} \theta_{2}^{m}} x^{n+m-1} t^{-(m+1)}, 0<x<\theta_{1}, 0<t<\infty, & 0<\frac{x}{t}<\theta_{2}  \tag{3.8}\\ 0, & \text { otherwise }\end{cases}
$$

$0<\frac{x}{t}<\theta_{2} 0<\mathrm{x}<\theta_{2} t$, also $0<\mathrm{x}<\theta_{1}$, therefore $0<\mathrm{x}<\min \left\{\theta_{1}, \theta_{2}\right\}$
If $0<\mathrm{t}<\frac{\theta_{1}}{\theta_{2}}$, this implies that $0<x<\theta_{2} t$
If $\frac{\theta_{1}}{\theta_{2}} \leq t<\infty, 0<x<\theta_{1}$
Therefore, the conditioned density of X given T is given by,
$\mathrm{h}\left(\mathrm{x}\right.$ I t $\left., \theta_{1}, \theta_{2}\right)=\left\{\begin{array}{c}\frac{n+m}{\theta_{2}^{n+m}} x^{m+n-1} t^{-(m+n)}, 0<t<\frac{\theta_{1}}{\theta_{2}}, 0<x<\theta_{2} t \\ \frac{n+m}{\theta_{1}^{n+m}} x^{m+n-1}, \frac{\theta_{1}}{\theta_{2}} \leq t<\infty, 0<x<\theta_{1}\end{array}\right.$
let $\mathrm{A}_{1}=\left(0, \sqrt[n]{\frac{\alpha(n+m)}{2 m}}\right), \mathrm{A}_{2}=\left(\sqrt[m]{\frac{2 n}{\alpha(m+n)}}, \infty\right)$ and $\mathrm{A}=\mathrm{A}_{1} \mathrm{U} \mathrm{A}_{2}$.
Consider the estimator $\mathrm{T}^{*}$ defined earlier,
$\mathrm{T}^{*}= \begin{cases}X, & \text { if T T } A \\ Z, & \text { if T } \epsilon A^{c}\end{cases}$
Thus, $\mathrm{T}^{*}=\mathrm{XI}_{A}(t)+Z \mathrm{I}_{A^{c}}(t)$
Therefore,
$\mathrm{E}\left(\mathrm{T}^{*}\right)=\mathrm{E}\left(\mathrm{XI}_{A}(t)\right)+\mathrm{E}\left(Z \mathrm{I}_{A^{c}}(t)\right)$
On $\mathrm{A}_{1}, 0<\mathrm{T}<\sqrt[n]{\frac{\alpha(n+m)}{2 m}}<\frac{\theta_{1}}{\theta_{2}}$, therefore,
$\mathrm{E}\left(\mathrm{XIt} \epsilon A_{1}\right)=\frac{n+m}{n+m+1} \theta_{2} t$

$$
\begin{align*}
\mathrm{E}\left(\mathrm{X} \mathrm{I}_{A_{1}}(t)\right) & =\frac{n+m}{n+m+1} \theta_{2} \frac{n m}{n+m}\left(\frac{\theta_{2}}{\theta_{1}}\right)^{n} \int_{0}^{\sqrt[n]{\frac{\alpha(n+m)}{2 m}}} t^{n} d t \\
& =\frac{\alpha}{2}\left(\frac{m+n}{n+m+1}\right)\left(\frac{n}{n+1}\right)\left\{\frac{\alpha(n+m)}{2 m}\right\}^{\frac{1}{n}} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}} \tag{3.10}
\end{align*}
$$

$\mathrm{E}\left(\mathrm{X}^{2} \mathrm{It} \epsilon A_{1}\right)=\frac{n+m}{n+m+2} \theta_{2}^{2} \mathrm{t}^{2}$

$$
\begin{align*}
\mathrm{E}\left(\mathrm{X}^{2} \mathrm{I}_{A_{1}}(t)\right) & =\frac{n+m}{n+m+2} \theta_{2}^{2} \frac{n m}{n+m}\left(\frac{\theta_{2}}{\theta_{1}}\right)^{n} \int_{0}^{\sqrt[n]{\frac{\alpha(n+m)}{2 m}}} t^{n+1} d t \\
& =\frac{\alpha}{2}\left(\frac{m+n}{n+m+2}\right)\left(\frac{n}{n+2}\right)\left\{\frac{\alpha(n+m)}{2 m}\right\}^{\frac{2}{n}} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}} \tag{3.11}
\end{align*}
$$

In general,
$\mathrm{E}\left(\mathrm{X}^{\mathrm{r}} \mathrm{I}_{A_{1}}(t)\right)=\frac{\alpha}{2}\left(\frac{m+n}{n+m+r}\right)\left(\frac{n}{n+r}\right)\left\{\frac{\alpha(n+m)}{2 m}\right\}^{\frac{r}{n}} \frac{\theta_{2}^{n+r}}{\theta_{1}^{n}}$
On $\mathrm{A}_{2}, \mathrm{t}>\frac{\theta_{1}}{\theta_{2}}$ and
$\mathrm{E}\left(\mathrm{X} \mid \mathrm{t} \in A_{2}\right)=\frac{n+m}{n+m+1} \theta_{1}$

$$
\begin{align*}
\mathrm{E}\left(\mathrm{X} \mathrm{I}_{A_{2}}(t)\right) & =\frac{n+m}{n+m+1} \theta_{1} \frac{n m}{n+m}\left(\frac{\theta_{1}}{\theta_{2}}\right)^{m} \int_{m}^{\infty} \frac{2 m}{\infty} \frac{1}{t^{m+1}} d t \\
& =\frac{\alpha}{2}\left(\frac{m+n}{n+m+1}\right)\left(\frac{\theta_{1}^{m+1}}{\theta_{2}^{m}}\right) \tag{3.12}
\end{align*}
$$

$\mathrm{E}\left(\mathrm{X}^{2} \mid \mathrm{t} \in A_{2}\right)=\frac{n+m}{n+m+2} \theta_{1}^{2}$

$$
\begin{equation*}
\mathrm{E}\left(\mathrm{X}^{2} \mathrm{I}_{A_{2}}^{2}(\mathrm{t})\right)=\frac{\alpha}{2}\left(\frac{m+n}{n+m+2}\right)\left(\frac{\theta_{1}^{m+2}}{\theta_{2}^{m}}\right) \tag{3.13}
\end{equation*}
$$

In general,
$\mathrm{E}\left(\mathrm{X}^{\mathrm{r}} \mathrm{I}_{A_{2}}^{r}(\mathrm{t})\right)=\frac{\alpha}{2}\left(\frac{m+n}{n+m+r}\right)\left(\frac{\theta_{1}^{m+r}}{\theta_{2}^{m}}\right), r>0$
But $\mathrm{T}^{*}=\mathrm{X}$ if $\mathrm{T} \epsilon \mathrm{A}_{1}$ or $\mathrm{T} \epsilon \mathrm{A}_{2}$, i.e. if $\mathrm{T} \epsilon \mathrm{A}$
Therefore actually we want,

$$
\mathrm{E}\left(\mathrm{X}_{A}(t)\right)=\mathrm{E}\left[\mathrm{XI}_{A_{1}}(t)+\mathrm{XI}_{A_{2}}(t)\right]
$$

$$
\begin{equation*}
=\frac{\alpha}{2}\left(\frac{m+n}{n+m+1}\right)\left\{\frac{n}{n+1}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{1}{n}} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}+\frac{\theta_{1}^{m+1}}{\theta_{2}^{m}}\right\} \tag{3.14}
\end{equation*}
$$

$\mathrm{E}\left(\mathrm{X}^{\mathrm{r}} \mathrm{I}_{A}^{r}(\mathrm{t})\right)=\mathrm{E}\left(\mathrm{X}^{\mathrm{r}} \mathrm{I}_{A_{1}}(t)\right)+\mathrm{E}\left(\mathrm{X}^{\mathrm{r}} \mathrm{I}_{A_{2}}(t)\right)$

$$
=\frac{\alpha}{2}\left(\frac{m+n}{n+m+r}\right)\left\{\frac{n}{n+r}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{r}{n}} \frac{\theta_{2}^{n+r}}{\theta_{1}^{n}}+\frac{\theta_{1}^{m+r}}{\theta_{2}^{m}}\right\}
$$

Consider,

$$
\begin{align*}
& \mathrm{E}\left[\left(\mathrm{XI}_{A}(t)-\theta_{1}\right)^{2}\right]=\mathrm{E}\left[\mathrm{X}^{2} \mathrm{I}_{A}(t)-2 \theta_{1} \mathrm{XI}_{A}(t)+\theta_{1}^{2}\right] \\
& =\mathrm{E}\left[\mathrm{X}^{2} \mathrm{I}_{A}(t)\right]-2 \theta_{1} \mathrm{E}\left[\mathrm{XI}_{A}(t)\right]+\theta_{1}^{2} \\
& = \\
& -\frac{\alpha}{2}\left(\frac{m+n}{n+m+1}\right)\left(\frac{m+n+3}{m+n+2}\right) \frac{\theta_{1}^{m+2}}{\theta_{2}^{m}}+ \\
& \frac{\alpha}{2} n(n+m)\left\{\frac{\alpha(m+n)}{2 m}\right\}^{\frac{1}{n}} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left[\left\{\frac{\alpha(m+n)}{2 m}\right\}^{\frac{1}{n}} \frac{\theta_{2}}{(n+2)(m+n+2)}-\frac{2 \theta_{1}}{(n+1)(m+n+1)}\right]+\theta_{1}^{2}  \tag{3.15}\\
& T^{*}=\left\{\begin{array}{lr}
X, & \text { if } 0<t<c_{1}, \\
Z, & \quad c_{2}<t<\infty \\
\text { if } c_{1} \leq t \leq c_{2}
\end{array}\right. \\
& Z=\max (\mathrm{T}, 1) \mathrm{I}_{A^{c}}(t), \quad \mathrm{A}^{\mathrm{c}}=\left(\mathrm{c}_{1}, \mathrm{c}_{2}\right)
\end{align*}
$$

Note that $c_{1}<\frac{\theta_{1}}{\theta_{2}}<c_{2}, \quad \mathrm{c}_{1}<1<\mathrm{c}_{2}$
4. $\mathbf{C A S E}-\mathrm{I} \quad \theta_{1}<\theta_{2}$
$T^{*}=\left\{\begin{array}{lr}X, & 0<t<c_{1} \\ Y, & c_{1} \leq t \leq \frac{\theta_{1}}{\theta_{2}} \\ Y, & \frac{\theta_{1}}{\theta_{2}} \leq t<1 \\ X, & 1 \leq t<c_{2} \\ X, & c_{2} \leq t<\infty\end{array}\right.$
Thus,
$\mathrm{T}^{*}=\mathrm{X}\left\{I_{(0, \mathrm{cl})(\mathrm{t})}+I_{(\mathrm{c} 2, \infty)}(\mathrm{t})\right\}+\mathrm{X} I_{(1, \mathrm{c}))}(\mathrm{t})+\mathrm{Y} I_{\left(c_{1}, \frac{\theta_{1}}{\theta_{2}}\right)}(\mathrm{t})+\mathrm{Y} I_{\left(\frac{\theta_{1}}{\theta_{2}}, 1\right)}(\mathrm{t})$
Therefore, $\mathrm{E}\left(\mathrm{T}^{*}\right)=\mathrm{a}+\mathrm{b}+\mathrm{c}+\mathrm{d}$;
Where, $\quad \mathrm{a}=\mathrm{E}\left[\mathrm{X}\left\{I_{(0, \mathrm{c} 1)}(\mathrm{t})+I_{(\mathrm{c} 2, \infty)}(\mathrm{t})\right\}\right], \quad \mathrm{b}=\mathrm{E}\left[\mathrm{X} I_{(1, \mathrm{c}))}(\mathrm{t})\right]$,
$\mathrm{c}=\mathrm{E}\left[\mathrm{Y} I_{\left(c_{1}, \frac{\theta_{1}}{\theta_{2}}\right)}(\mathrm{t})\right], \quad \mathrm{d}=\mathrm{E}\left[\mathrm{Y} I_{\left(\frac{\theta_{1}}{\theta_{2}}, 1\right)}(\mathrm{t})\right]$

$$
\begin{aligned}
& \mathrm{a}=\mathrm{E}\left[\mathrm{X}\left\{I_{(0, \mathrm{cl})}(\mathrm{t})+I_{(\mathrm{c} 2, \infty)}(\mathrm{t})\right\}\right] \\
&=\frac{\alpha}{2}\left(\frac{m+n}{n+m+1}\right)\left\{\frac{n}{n+1}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{1}{n}} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}+\frac{\theta_{1}^{m+1}}{\theta_{2}^{m}}\right\} \\
& \mathrm{E}\left[\mathrm{X}^{2}\left\{I_{\left(0, c_{1}\right)}(t)+I_{\left(c_{2}, \infty\right)}(t)\right\}\right]=\frac{\alpha}{2}\left(\frac{m+n}{n+m+2}\right)\left\{\frac{n}{n+2}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{1}{n}} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}+\frac{\theta_{1}^{m+2}}{\theta_{2}^{m}}\right\} \\
& \mathrm{b}=\mathrm{E}\left[\mathrm{X} I_{\left(1, c_{2}\right)}(t)\right]=\mathrm{E}\left[I_{\left(1, c_{2}\right)}(t) \mathrm{E}\left[\mathrm{XIt} \epsilon\left(1, \mathrm{c}_{2}\right)\right]\right] \\
&=\left(\frac{m+n}{n+m+1}\right) \theta_{1} \int_{1}^{c_{1}} \frac{n m}{n+m}\left(\frac{\theta_{1}}{\theta_{2}}\right)^{m} \frac{1}{t^{m+1}} d t \\
&=\frac{n \theta_{1}^{m+1}}{(n+m+1) \theta_{2}^{m}}-\frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{1}^{m+1}}{\theta_{2}^{m}} \\
& \mathrm{E}\left[\mathrm{X}^{2} I_{\left(1, c_{2}\right)}(\mathrm{t})\right]=\frac{n \theta_{1}^{m+2}}{(n+m+2) \theta_{2}^{m}}-\frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{1}^{m+2}}{\theta_{2}^{m}} .
\end{aligned}
$$

Now, we consider

$$
\begin{aligned}
& \mathrm{c}=\mathrm{E}\left[\mathrm{Y} I_{\left(c_{1}, \frac{\theta_{1}}{\theta_{2}}\right)}(\mathrm{t})\right]=\mathrm{E}\left[I_{\left(c_{1}, \frac{\theta_{1}}{\theta_{2}}\right)}(\mathrm{t}) \mathrm{E}\left[\mathrm{YIt} \epsilon\left(c_{1}, \frac{\theta_{1}}{\theta_{2}}\right)\right]\right. \\
& \\
& =\left(\frac{m+n}{n+m+1}\right) \theta_{2} \frac{m n}{m+}\left(\frac{\theta_{2}}{\theta_{1}}\right)^{n} \int_{c_{1}}^{\frac{\theta_{1}}{\theta_{2}}} t^{n-1} d t=\frac{m \theta_{2}}{n+m+1}-\frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}} \\
& \mathrm{E}\left[\mathrm{Y}^{2} I_{\left(c_{1}\right.}, \frac{\theta_{1}}{\theta_{2}}\right) \\
& (\mathrm{t})]=\frac{m \theta_{2}^{2}}{n+m+2}-\frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}} \\
& \mathrm{~d}=\mathrm{E}\left[\mathrm{Y} I_{\left(\frac{\theta_{1}}{\theta_{2}}, 1\right)}^{(\mathrm{t})]=\mathrm{E}\left[I_{( }\left(\frac{\theta_{1}}{\theta_{2}}, 1\right)\right.}(\mathrm{t}) \mathrm{E}\left[\mathrm{Y} \operatorname{It} \epsilon\left(\frac{\theta_{1}}{\theta_{2}}, 1\right)\right]\right. \\
& \\
& =\left(\frac{m+n}{n+m+1}\right) \theta_{1}\left(\frac{\theta_{1}}{\theta_{2}}\right)^{m} \frac{m n}{m+n} \int_{\frac{\theta_{1}}{\theta_{2}}}^{1} \frac{1}{t^{m+2}} d t \\
& \\
& =\frac{m n \theta_{2}}{(m+1)(m+n+1)}-\frac{m n \theta_{1}^{m+1}}{(m+1)(m+n+1) \theta_{2}^{m}}
\end{aligned}
$$

$$
\mathrm{E}\left(\mathrm{Y}^{2} I_{\left(\frac{\theta_{1}}{\theta_{2}}, 1\right)}(\mathrm{t})\right)=\frac{m n \theta_{2}^{2}}{(m+2)(m+n+2)}-\frac{m n \theta_{1}^{m+2}}{(m+2)(m+n+2) \theta_{2}^{m}}
$$

From a, b, c and d

$$
\begin{aligned}
& \mathrm{E}\left(\mathrm{~T}^{*}\right)=\quad \frac{\alpha}{2}\left(\frac{m+n}{n+m+1}\right)\left\{\frac{n}{n+1}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{1}{n}} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}+\frac{\theta_{1}^{m+1}}{\theta_{2}^{m}}\right\} \\
& \frac{n \theta_{1}^{m+1}}{(n+m+1) \theta_{2}^{m}}- \\
& \frac{m n \theta_{2}}{(m+1)(m+n+1)} \frac{\alpha}{m+n+1} \frac{m+n}{\theta_{2}^{m}}+\frac{m \theta_{2}}{n+m+1}-\frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}+ \\
& -\frac{m n \theta_{1}^{m+1}}{(m+1)(m+n+1) \theta_{2}^{m}}
\end{aligned}
$$

Thus,
$\mathrm{E}\left(\mathrm{T}^{*}\right)=\frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{1}{n}}-1\right\}+\frac{n \theta_{1}^{m+1}}{(m+1)(n+m+1) \theta_{2}^{m}}+\frac{m \theta_{2}}{m+1}$
In estimating $\theta_{1}$ by $\mathrm{T}^{*}$ the bias is,

$$
\begin{align*}
& b_{T^{*}}\left(\frac{\theta_{1}}{\theta_{2}}\right)=\mathrm{E}\left(\mathrm{~T}^{*}\right)-\theta_{1} \\
& \quad=\frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{1}{n}}-1\right\}+\frac{n \theta_{1}^{m+1}}{(m+1)(n+m+1) \theta_{2}^{m}}+\frac{m \theta_{2}}{m+1}-\theta_{1} \tag{4.3}
\end{align*}
$$

We also have,

$$
\begin{align*}
& \begin{aligned}
& \mathrm{E}\left(\mathrm{~T}^{* 2}\right)= \mathrm{E}\left[\mathrm{X}^{2}\left\{I_{\left(0, c_{1}\right)}(\mathrm{t})+I_{\left(c_{2, \infty}\right)}(\mathrm{t})\right\}\right]+\mathrm{E}\left[\mathrm{X}^{2} I_{\left(1, c_{2}\right)}(\mathrm{t})\right]+\mathrm{E}\left[\mathrm{Y}^{2} I_{\left(c_{1}, \frac{\theta_{1}}{\theta_{2}}\right)}\right. \\
&+\mathrm{E}\left[\mathrm{Y}^{2} I_{\left(\frac{\theta_{1}}{\theta_{2}^{2}}, 1\right)}(\mathrm{t})\right] \\
&=\frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}\left\{\frac{n}{n+2}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{2}{n}}-1\right\} \\
&+\frac{n \theta_{1}^{m+2}}{(n+m+2) \theta_{2}^{m}}\left[1-\frac{m}{m+2}\right]+\frac{m \theta_{2}^{2}}{m+n+2}\left[1+\frac{n}{m+2}\right] \\
& \mathrm{E}\left(\mathrm{~T}^{* 2}\right)=\frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}\left\{\frac{n}{n+2}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{2}{n}}-1\right\}+\frac{2 n \theta_{1}^{m+2}}{(m+2)(n+m+2) \theta_{2}^{m}}+\frac{m \theta_{2}^{2}}{m+2}
\end{aligned} \tag{t}
\end{align*}
$$

The MSE (mean squared error) of $\mathrm{T}^{*}$ in estimating $\theta_{1}$ is given by,

$$
\begin{aligned}
\mathrm{E}\left(\mathrm{~T}^{*}-\theta_{1}\right)^{2}=\mathrm{E}\left(\mathrm{~T}^{*}\right)^{2}-2 \theta_{1} \mathrm{E}\left(\mathrm{~T}^{*}\right)+\theta_{1}^{2}= & \frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}\left\{\frac{n}{n+2}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{2}{n}}-1\right\} \\
& -\alpha \frac{n+m}{n+m+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n-1}}\left[\frac{n}{n+1}\left\{\alpha \frac{(n+m)}{2 m}\right\}^{\frac{1}{n}}-1\right]
\end{aligned}
$$

$$
\begin{equation*}
-\frac{2 n(2 m+n+3) \theta_{1}^{m+2}}{(m+1)(m+2)(m+n+1)(n+m+2) \theta_{2}^{m}}+\frac{m \theta_{2}^{2}}{m+2}-\frac{2 m \theta_{1} \theta_{2}}{m+1}+\theta_{1}^{2} \tag{4.5}
\end{equation*}
$$

If $m=n$,

$$
\begin{equation*}
b_{T^{*}}\left(\frac{\theta_{1}}{\theta_{2}}\right)=\frac{n}{n+1}\left[\frac{\alpha n}{2 n+1} \frac{\theta_{2}}{\theta^{n}}\left\{\alpha^{\frac{1}{n}}-\frac{n+1}{n}\right\}+\theta_{1}\left\{\frac{\theta^{n}}{2 n+1}-\frac{n+1}{n}\right\}+\theta_{2}\right] \tag{4.6}
\end{equation*}
$$

where, $\theta=\frac{\theta_{1}}{\theta_{2}}$.
5.CASE- II: $\theta_{1}>\theta_{2}$

In this situation, $\frac{\theta_{1}}{\theta_{2}}>1$. $c_{1}<1<c_{2}, c_{1}<\frac{\theta_{1}}{\theta_{2}}<c_{2}, c_{1}<1<\frac{\theta_{1}}{\theta_{2}}<c_{2}$

$$
T^{*}=\left\{\begin{array}{l}
X, \text { if } 0<t<c_{1} \\
Y, \text { if } c_{1} \leq t<1 \\
X, \text { if } 1 \leq t<\frac{\theta_{1}}{\theta_{2}} \\
X, \text { if } \frac{\theta_{1}}{\theta_{2}} \leq t<\infty
\end{array}\right.
$$

Thus,

$$
\begin{align*}
T^{*} & =\mathrm{X} I_{\left(0, c_{1}\right)}+\mathrm{Y} I_{\left(c_{1,1}\right)}(\mathrm{t})+\mathrm{X} I_{\left(1, \frac{\theta_{1}}{\theta_{2}}\right.}(\mathrm{t})+\mathrm{XI}\left(\frac{\theta_{1}}{\theta_{2}}, \infty\right)^{(\mathrm{t})}  \tag{5.1}\\
& =(\mathrm{I})+(\mathrm{II})+(\mathrm{III})+(\mathrm{IV}) \\
\mathrm{E}(\mathrm{I}) & =\mathrm{E}\left[\mathrm{X} I_{\left(0, c_{1}\right)}(\mathrm{t})\right] \\
& =\mathrm{E}\left[I_{\left(0, c_{1}\right)}(\mathrm{t}) \mathrm{E}\left\{\mathrm{XIt} \epsilon\left(0, c_{1}\right)\right\}\right] \\
& =\frac{n+m}{n+m+1} \theta_{2} \int_{0}^{c_{1}} t h_{T}\left(t \mid \theta_{1}, \theta_{2}\right) d t, \quad c_{1}=\left[\frac{\alpha(m+n)}{2 m}\right]^{\frac{1}{n}} \\
& =\frac{m n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}} \frac{1}{n+1}\left\{\frac{\alpha(m+n)}{2 m}\right\}^{\frac{n+1}{n}}
\end{align*}
$$

$$
\begin{aligned}
\mathrm{E}\left(\mathrm{I}^{2}\right) & =\mathrm{E}\left[\mathrm{X}^{2} I_{\left(0, c_{1}\right)}(\mathrm{t})\right] \\
& =\frac{m n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}} \frac{1}{n+2}\left\{\frac{\alpha(m+n)}{2 m}\right\}^{\frac{n+2}{n}} \\
\mathrm{E}(\mathrm{II}) & =\mathrm{E}\left[I_{\left(c_{1,1}\right)}(\mathrm{t}) \mathrm{E}\left\{\mathrm{YI} \mathrm{t} \epsilon\left(c_{1}, 1\right)\right\}\right] \\
& =\frac{n+m}{n+m+1} \theta_{1} \int_{c_{1}}^{1} \frac{1}{t} h_{T}\left(t \mid \theta_{1}, \theta_{2}\right) d t \\
& =\frac{n+m}{n+m+1} \theta_{2} \frac{n m}{m+n}\left(\frac{\theta_{2}}{\theta_{1}}\right)^{n} \frac{1}{n}\left(1-c_{1}^{n}\right) \\
& =\frac{m}{n+m+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left[1-\frac{\alpha(m+n)}{2 m}\right] \\
& =\frac{m \theta_{2}^{n+1}}{(n+m+1) \theta_{1}^{n}}-\frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}} \\
\mathrm{E}\left(\mathrm{II}{ }^{2}\right) & =\mathrm{E}\left[\mathrm{Y}^{2} I_{\left(c_{1,1)}(\mathrm{t})\right]}^{\mathrm{E}(\mathrm{III})}\right.
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{E}\left(\mathrm{III}{ }^{2}\right) & =\mathrm{E}\left[\mathrm{X}^{2} I_{\left(1, \frac{\theta_{1}}{\theta_{2}}\right)}(\mathrm{t})\right] \\
& =\frac{m n \theta_{1}^{2}}{(n+2)(m+n+2)}-\frac{m n \theta_{2}^{n+2}}{(n+2)(m+n+2) \theta_{1}^{n}}
\end{aligned}
$$

$$
\mathrm{E}(\mathrm{IV})=\mathrm{E}\left[\mathrm{X} I\left(\frac{\theta_{1}}{\theta_{2}}, \infty\right)^{(\mathrm{t})}\right]
$$

$$
\begin{aligned}
& \begin{aligned}
& =\frac{m+n}{m+n+1} \frac{\theta_{1}^{m+1}}{\theta_{2}^{m}} \frac{n m}{m+n} \int_{\theta_{1} / \theta_{2}}^{\infty} \frac{1}{t^{m+1}} d t \\
& =\frac{n \theta_{1}^{m+1}}{(m+n+1) \theta_{2}^{m}}\left(\frac{\theta_{2}^{m}}{\theta_{1}^{m}}\right) \\
\mathrm{E}(\mathrm{IV}) & =\frac{n \theta_{1}}{m+n+1} \\
\mathrm{E}\left(\mathrm{IV}^{2}\right) & =\mathrm{E}\left[\mathrm{X}^{2} I\left(\frac{\theta_{1}}{\theta_{2}}, \infty\right)\right.
\end{aligned} \\
& \quad=\frac{m+n}{m+n+2} \frac{\theta_{1}^{m+2}}{\theta_{2}^{m}} \frac{n m}{n+m} \frac{1}{m}\left(\frac{\theta_{2}^{m}}{\theta_{1}^{m}}\right) \\
&=\frac{n \theta_{1}^{2}}{m+n+2}
\end{aligned}
$$

Thus,

$$
\begin{align*}
\mathrm{E}\left(T^{*}\right)= & \frac{m n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}} \frac{1}{n+1}\left\{\frac{\alpha(m+n)}{2 m}\right\}^{\frac{n+1}{n}}+\frac{m \theta_{2}^{n+1}}{(n+m+1) \theta_{1}^{n}}-\frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}} \\
& +\frac{m n \theta_{1}}{(n+1)(m+n+1)}-\frac{m n \theta_{2}^{n+1}}{(n+1)(m+n+1) \theta_{1}^{n}}+\frac{n \theta_{1}}{m+n+1} . \\
= & \begin{aligned}
\left.\begin{array}{l}
\alpha \\
\frac{\theta_{2}^{n+1}(m+n)}{(m+n+1) \theta_{1}^{n}}\left[\frac{n}{n+1}\left\{\frac{\alpha(n+m)}{2 m}\right\}^{\frac{1}{n}}-1\right]+\frac{m \theta_{2}^{n+1}}{(m+n+1) \theta_{1}^{n}}\left[1-\frac{n}{n+1}\right]+ \\
\\
\\
\mathrm{E}\left(T^{*}\right)= \\
\frac{n \theta_{1}}{m+n+1}\left\{\frac{m}{n+1}+1\right\} \\
m+n+1 \\
\theta_{2}^{n+1}
\end{array} \frac{n}{n+1}\left\{\frac{\alpha(n+m)}{2 m}\right\}^{\frac{1}{n}}-1\right]+\frac{m \theta_{2}^{n+1}}{(n+1)(m+n+1) \theta_{1}^{n}}+\frac{n \theta_{1}}{n+1}
\end{aligned} \\
\mathrm{E}\left(T^{*^{2}}\right)= & \frac{m n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}} \frac{1}{n+2}\left\{\frac{\alpha(m+n)}{2 m}\right\}^{\frac{n+2}{n}}+\frac{m \theta_{2}^{n+2}}{(n+m+2) \theta_{1}^{n}}-\frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}} \\
& +\frac{m n \theta_{1}^{2}}{(n+2)(m+n+2)}-\frac{m n \theta_{2}^{n+2}}{(n+2)(m+n+2) \theta_{1}^{n}}+\frac{n \theta_{1}^{2}}{m+n+2}
\end{align*}
$$

$$
\begin{align*}
& = \\
& \begin{array}{l}
\frac{\alpha}{2} \frac{\theta_{2}^{n+2}(m+n)}{(m+n+2) \theta_{1}^{n}}\left[\frac{n}{n+2}\left\{\frac{\alpha(n+m)}{2 m}\right\}^{\frac{2}{n}}-1\right]+\frac{m \theta_{2}^{n+2}}{(m+n+2) \theta_{1}^{n}}\left[1-\frac{n}{n+2}\right]+ \\
\quad \frac{n \theta_{1}^{2}}{m+n+2}\left\{\frac{m}{n+2}+1\right\} \\
\mathrm{E}\left(T^{* 2}\right)=\frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}\left[\frac{n}{n+2}\left\{\frac{\alpha(n+m)}{2 m}\right\}^{\frac{2}{n}}-1\right]+\frac{2 m \theta_{2}^{n+2}}{(n+2)(m+n+2) \theta_{1}^{n}}+\frac{n \theta_{1}^{2}}{n+2}
\end{array}
\end{align*}
$$

In this situation, i.e., when $\theta_{1}>\theta_{2}$ the bias of $T^{*}$ in estimating $\theta_{1}$ is given by,

$$
\begin{align*}
b_{T^{*}}\left(\frac{\theta_{1}}{\theta_{2}}\right) & =\mathrm{E}\left(\mathrm{~T}^{*}\right)-\theta_{1} \\
& =\frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{1}{n}}-1\right\}+\frac{m \theta_{2}^{n+1}}{(n+1)(n+m+1) \theta_{1}^{n}}-\frac{\theta_{1}}{n+1} \tag{5.4}
\end{align*}
$$

Also

$$
\begin{align*}
& \mathrm{E}\left(\mathrm{~T}^{*}-\theta_{1}\right)^{2}=\mathrm{E}\left(\mathrm{~T}^{*}\right)^{2}-2 \theta_{1} \mathrm{E}\left(\mathrm{~T}^{*}\right)+\theta_{1}{ }^{2} \\
& =\frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}\left\{\frac{n}{n+2}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{2}{n}}-1\right\}- \\
& \alpha \frac{n+m}{n+m+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n-1}}\left[\frac{n}{n+1}\left\{\alpha \frac{(n+m)}{2 m}\right\}^{\frac{1}{n}}-\quad 1\right]+\frac{2 m \theta_{2}^{n+2}}{(n+2)(n+m+2) \theta_{1}^{n}}+\frac{n \theta_{1}^{2}}{n+2}- \\
& \frac{m \theta_{2}^{n+1}}{(n+1)(m+n+1) \theta_{1}^{n-1}}-\frac{2 n \theta_{1}^{2}}{n+1}+\theta_{1}^{2} \\
& =\frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}\left\{\frac{n}{n+2}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{2}{n}}-1\right\}- \\
& \alpha \frac{n+m}{n+m+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n-1}}\left[\frac{n}{n+1}\left\{\alpha \frac{(n+m)}{2 m}\right\}^{\frac{1}{n}}-\quad 1\right]+\frac{m \theta_{2}^{n+1}}{\theta_{1}^{n}}\left[\frac{2 \theta_{2}}{(n+2)(n+m+2)}-\right. \\
& \left.\frac{\theta_{1}}{(n+1)(m+n+1)}\right]+\theta_{1}^{2}\left[\frac{n}{n+2}-\frac{2 n}{n+1}+1\right] \\
& = \\
& \frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}\left\{\frac{n}{n+2}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{2}{n}}-1\right\} \alpha \frac{n+m}{n+m+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n-1}}\left[\frac{n}{n+1}\left\{\alpha \frac{(n+m)}{2 m}\right\}^{\frac{1}{n}}-\right. \\
& 1]+\frac{m \theta_{2}^{n+1}}{\theta_{1}^{n}}\left[\frac{2 \theta_{2}}{(n+2)(n+m+2)}-\frac{\theta_{1}}{(n+1)(m+n+1)}\right]+\frac{2 \theta_{1}^{2}}{(n+1)(n+2)} \tag{5.5}
\end{align*}
$$

## 6. CASES I AND II TOGETHER.

Thus, from the cases I and II above we conclude that,

$$
\begin{align*}
& T^{*} \\
& =\left\{\begin{array}{l}
X\left\{I_{\left(0, c_{1}\right)}(t)+I_{(1, \infty)}(t)\right\}+Y\left\{I_{\left(c_{1}, \frac{\theta_{1}}{\theta_{2}}\right)}(t)+I_{\left(\frac{\theta_{1}, 1}{\theta_{2}}\right)}(t)\right\}, \quad \text { if } \theta_{1}<\theta_{2} \\
X\left\{I_{\left(0, c_{1}\right)}(t)+I_{(1, \infty)}(t)\right\}+Y I_{\left(c_{1}, 1\right)}(t), \quad \text { if } \theta_{1} \geq \theta_{2}
\end{array}\right. \tag{6.1}
\end{align*}
$$

Its bias is given by,
$b_{T^{*}}\left(\theta_{1}, \theta_{2}\right)=$
$\left\{\begin{array}{l}\frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{1}{n}}-1\right\}+\frac{n \theta_{1}^{m+1}}{(m+1)(n+m+1) \theta_{2}^{m}}+\frac{m \theta_{2}}{m+1}-\theta_{1}, \text { if } \theta_{1}<\theta_{2} \\ \frac{\alpha}{2} \frac{m+n}{m+n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{1}{n}}-1\right\}+\frac{m \theta_{2}^{n+1}}{(n+1)(n+m+1) \theta_{1}^{n}}-\frac{\theta_{1}}{n+1}, \quad \text { if } \theta_{1} \geq \theta_{2}\end{array}\right.$

The MSE of $T^{*}$ is given by,

$$
\mathrm{E}\left(\mathrm{~T}^{*}-\theta_{1}\right)^{2}
$$

$=\left\{\begin{array}{l}b_{2}-\frac{2 n(2 m+n+3) \theta_{1}^{m+2}}{(m+1)(m+2)(n+m+1)(n+m+2) \theta_{2}^{m}}+\frac{m \theta_{2}^{2}}{m+2}-\frac{2 m \theta_{1} \theta_{2}}{m+1}+\theta_{1}^{2}, \text { if } \theta_{1}<\theta_{2} \\ b_{2}+\frac{m \theta_{2}^{n+1}}{\theta_{1}^{n}}\left[\frac{2 \theta_{2}}{(n+2)(n+m+2)}-\frac{\theta_{1}}{(n+1)(n+m+1)}\right]+\frac{2 \theta_{1}^{2}}{(n+1)(n+2)}, \text { if } \theta_{1} \geq \theta_{2}\end{array}\right.$
Where
$\mathrm{b}_{2}=\frac{\alpha}{2} \frac{m+n}{m+n+2} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}\left\{\frac{n}{n+2}\left(\frac{\alpha(m+n)}{2 m}\right)^{\frac{2}{n}}-1\right\}-\alpha \frac{n+m}{n+m+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n-1}}\left[\frac{n}{n+1}\left\{\frac{\alpha(n+m)}{2 m}\right\}^{\frac{1}{n}}-1\right]$
If $\mathrm{n}=\mathrm{m}, \quad \mathrm{c}_{1}=\alpha^{\frac{1}{n}}, \quad \mathrm{c}_{2}=\left(\frac{1}{\alpha}\right)^{1 / m}$ and

$$
\begin{align*}
& b_{T^{*}}\left(\theta_{1}, \theta_{2}\right) \\
& =\left\{\begin{array}{c}
\frac{\alpha}{2} \frac{2 n}{2 n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}(\alpha)^{\frac{1}{n}}-1\right\}+\frac{n \theta_{1}^{n+1}}{(n+1)(2 n+1) \theta_{2}^{n}}+\frac{n \theta_{2}}{n+1}-\theta_{1}, \text { if } \theta_{1}<\theta_{2} \\
\frac{2 n}{2 n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}(\alpha)^{\frac{1}{n}}-1\right\}+\frac{n \theta_{2}^{n+1}}{(n+1)(2 n+1) \theta_{1}^{n}}-\frac{\theta_{1}}{n+1} \text {, if } \theta_{1} \geq \theta_{2}
\end{array}\right. \\
& b_{T^{*}}\left(\theta_{1}, \theta_{2}\right)= \\
& \left\{\begin{array}{c}
\frac{\alpha n}{2 n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}(\alpha)^{\frac{1}{n}}-1\right\}+\frac{n \theta_{1}^{n+1}}{(n+1)(2 n+1) \theta_{2}^{n}}+\frac{n \theta_{2}}{n+1}-\theta_{1}, \text { if } \theta_{1}<\theta_{2} \\
\frac{\alpha n}{2 n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}(\alpha)^{\frac{1}{n}}-1\right\}+\frac{n \theta_{2}^{n+1}}{(n+1)(2 n+1) \theta_{1}^{n}}-\frac{\theta_{1}}{n+1}, \text { if } \theta_{1} \geq \theta_{2}
\end{array}\right. \tag{6.5}
\end{align*}
$$

If $\alpha=0, T^{*}$ gives always pooled estimator and $c_{1}=0, c_{2}=\infty$. This gives

$$
b_{T^{*}}\left(\theta_{1}, \theta_{2}\right)= \begin{cases}\frac{n \theta_{1}^{m+1}}{(m+1)(n+m+1) \theta_{2}^{m}}+\frac{m \theta_{2}}{m+1}-\theta_{1}, & \text { if } \theta_{1}<\theta_{2}  \tag{6.6}\\ \frac{m \theta_{2}^{n+1}}{(n+1)(n+m+1) \theta_{1}^{n}}-\frac{\theta_{1}}{n+1}, & \text { if } \theta_{1} \geq \theta_{2}\end{cases}
$$

If $\mathrm{n}=\mathrm{m}$, this becomes,

$$
b_{T^{*}}\left(\theta_{1}, \theta_{2}\right)=\left\{\begin{array}{l}
\frac{n \theta_{1}^{n+1}}{(n+1)(2 n+1) \theta_{2}^{m}}+\frac{n \theta_{2}}{n+1}-\theta_{1}, \text { if } \theta_{1}<\theta_{2}  \tag{6.7}\\
\frac{n \theta_{2}^{n+1}}{(n+1)(2 n+1) \theta_{1}^{n}}-\frac{\theta_{1}}{n+1}, \text { if } \theta_{1} \geq \theta_{2}
\end{array}\right.
$$

In this putting $\theta_{1}=\theta_{2}$, we have

$$
\begin{aligned}
b_{T^{*}}\left(\theta_{1}\right) & =\frac{n \theta_{1}^{n+1}}{(n+1)(2 n+1) \theta_{1}^{n}}+\frac{n \theta_{1}}{n+1}-\theta_{1} \\
& =\frac{n \theta_{1}-2 n \theta_{1}-\theta_{1}}{(n+1)(2 n+1)} \\
& =\frac{-\theta_{1}(n+1)}{(n+1)(2 n+1)} \\
& =-\frac{\theta_{1}}{2 n+1}: \text { the bias of the maximum of a sample of size } 2 \mathrm{n} .
\end{aligned}
$$

If $m=n$ the MSE of $T^{*}$ is given by,

$$
\mathrm{E}\left(\mathrm{~T}^{*}-\theta_{1}\right)^{2}=\left\{\begin{array}{c}
b_{2}^{\prime}-\frac{n \theta_{1}^{n+2}}{(n+2)(2 n+1)(2 n+2) \theta_{2}^{n}}+\frac{n \theta_{2}^{2}}{n+2}-\frac{2 n \theta_{1} \theta_{2}}{n+1}+\theta_{1}^{2} \text {, if } \theta_{1}<\theta_{2}  \tag{6.8}\\
b_{2}^{\prime}+\frac{n \theta_{2}^{n+1}}{\theta_{1}^{n}}\left[\frac{2 \theta_{2}}{(n+2)(2 n+2)}-\frac{\theta_{1}}{(n+1)(2 n+1)}\right]+\frac{2 \theta_{1}^{2}}{(n+1)(n+2)} \text {, if } \theta_{1} \geq \theta_{2}
\end{array}\right.
$$

Where
$b_{2}^{\prime}=\frac{\alpha}{2} \frac{n}{n+1} \frac{\theta_{2}^{n+2}}{\theta_{1}^{n}}\left[\frac{n}{n+2} \alpha^{\frac{2}{n}}-1\right]-\alpha \frac{2 n}{2 n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n-1}}\left[\frac{n}{n+1} \alpha^{\frac{1}{n}}-1\right]$
If $\alpha=0$, in this, then, $b_{2}^{\prime}=0$ and

$$
\begin{align*}
\mathrm{E}\left(\mathrm{~T}^{*}-\theta_{1}\right)^{2} & =\left\{\begin{aligned}
-\frac{6 n \theta_{1}^{n+2}}{(n+2)(2 n+1)(2 n+2) \theta_{2}^{n}}+\frac{n \theta_{2}^{2}}{n+2}-\frac{2 n \theta_{1} \theta_{2}}{n+1}+\theta_{1}^{2}, \text { if } \theta_{1}<\theta_{2} \\
\frac{n \theta_{2}^{n+1}}{(n+1) \theta_{1}^{n}}\left[\frac{\theta_{2}}{(n+2)}-\frac{\theta_{1}}{(2 n+1)}\right]+\frac{2 \theta_{1}^{2}}{(n+1)(n+2)}, \text { if } \theta_{1} \geq \theta_{2}
\end{aligned}\right.  \tag{6.9}\\
& =\frac{\theta_{1}^{2}}{(n+1)(2 n+1)} . \tag{6.10}
\end{align*}
$$

(6.10)is the MSE of the maximum in the 2 n observations, if $\theta_{1}=\theta_{2}$.

If $\alpha=1, m=n$ we have $c_{1}=c_{2}=1$ and $T^{*}$ becomes never pool estimator. In this case
$b_{T^{*}}\left(\theta_{1}, \theta_{2}\right)=\left\{\begin{array}{c}\frac{n}{2 n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}-1\right\}+\frac{n \theta_{1}^{n+1}}{(n+1)(2 n+1) \theta_{2}^{n}}+\frac{n \theta_{2}}{n+1}-\theta_{1} \text {, if } \theta_{1}<\theta_{2} \\ \frac{n}{2 n+1} \frac{\theta_{2}^{n+1}}{\theta_{1}^{n}}\left\{\frac{n}{n+1}-1\right\}+\frac{n \theta_{2}^{n+1}}{(n+1)(2 n+1) \theta_{1}^{n}}-\frac{\theta_{1}}{n+1} \text {, if } \theta_{1} \geq \theta_{2}\end{array}\right.$
If $\theta_{1}=\theta_{2}$, this becomes,

$$
\begin{align*}
b_{T^{*}}\left(\theta_{1}\right) & =-\frac{n \theta_{1}}{(2 n+1)(n+1)}+\frac{n \theta_{1}}{(n+1)(2 n+1)}-\frac{\theta_{1}}{n+1} \\
& =-\frac{\theta_{1}}{n+1} \tag{6.12}
\end{align*}
$$

(6.12) gives bias of the maximum in $n$ observations in single sample.

If $\mathrm{m}=\mathrm{n}, \alpha=1$,
$\mathrm{b}_{2}=\frac{n \theta_{2}^{n+2}}{(n+1) \theta_{1}^{n}}\left[\frac{2 n\left(\theta_{1}-\theta_{2}\right)+4 \theta_{1}-\theta_{2}}{(n+2)(2 n+1) \theta_{2}}\right]$
If $\theta_{1}=\theta_{2}$, this becomes,
$\mathrm{b}_{2}=\frac{3 n \theta_{1}^{2}}{(n+1)(n+2)(2 n+1)}$.
If $\mathrm{n}=\mathrm{m}, \alpha=1, \theta_{1}=\theta_{2}$
$\mathrm{E}\left(\mathrm{T}^{*}-\theta_{1}\right)^{2}=\frac{2 \theta_{1}^{2}}{(n+1)(n+2) .}:$ MSE of maximum of sample of size $n$ (i.e., of X$)$.
Note that,

$$
\frac{\theta_{1}^{2}}{(n+1)(2 n+1)}<\frac{2 \theta_{1}^{2}}{(n+1)(n+2)}, \quad \forall \mathrm{n} \geq 1 \text { and } \theta_{1}>0 .
$$

That is, MSE of proposed estimator $\mathrm{T}^{*}$ is smaller than that of the sample maximum of size $n \forall n \geq 1$ and $\theta_{1}>0$.

## 7. COMPARISON OF ESTIMATORS:

To have an idea of comparative values of mean square error (MSE) of the proposed estimator $\mathrm{T}^{*}$ and the variance $V=\frac{\theta_{1}^{2}}{n(n+2)}$ of uniformly minimum variance unbiased (UMVU) Estimator based on the single sample, $T=\frac{(n+1)}{n} X$, we calculate them for some particular values. $\mathrm{T}^{*}$ would provide
better estimator when $\theta_{1}=\theta_{2}$. For the sake of convenience, let us take $\theta_{2}=1$ and $\theta_{1}=0.4,0.5, \ldots, 1.3$ etc. Using these values of the parameters we evaluate MSE of $\mathrm{T}^{*}$ and the variance $V$ of UMVUE based on single sample. For small samples T* gives smaller MSE than $V$. This is illustrated by choosing some values of the sample sizes n and m . Following tables and the graphs make it clear that whenever $\theta_{1}=\theta_{2}, T^{*}$ can be used in a short span of the values. But, we can not say that $\mathrm{T}^{*}$ is uniformly better than T for all $\theta_{1}, \theta_{2}$, and for all $\mathrm{n}, \mathrm{m}$. Thus, the proposed estimator $\mathrm{T}^{*}$ can be profitably used in the specific region, with care. If the sample sizes are more than 15 , the UMVUE is consistently better than $\mathrm{T}^{*}$ as its variance is less than the corresponding MSE of $\mathrm{T}^{*}$. In this discussion I did not consider the magnitude of the bias of $\mathrm{T}^{*}$. But, I have derived expressions for bias of $\mathrm{T}^{*}$ in various situations.

1. Here we consider $n=3, m=8$ and $\boldsymbol{\theta}_{2}=1$. The $\operatorname{MSE}\left(\mathbf{T}^{*}\right)$ and Variance $V$ are as below

## Table 7.1

$\operatorname{MSE}\left(T^{*}\right)$, VARIANCE $V$ WHEN $n=3, m=8$ AND $\boldsymbol{\theta}_{2}=1$

| $\boldsymbol{\theta}_{\mathbf{1}}$ | $\mathbf{n}$ | $\mathbf{m}$ | $\mathbf{m s e}$ | var |
| :---: | :---: | :---: | :---: | :---: |
| 0.4 | 3 | 8 | 0.155928 | 0.010667 |
